

Dealing with documents as images

LumiFind has a feature called: "Treat Images as Documents".

If this feature is enabled under [Settings](#) -> [Analysis Settings](#), the images found under the "Included Folders" will be treated as documents and the text will be extracted for quick search.

For Mac and Linux users, this will work out-of-the-box. However, Windows users need to install third-party tools to achieve that.

On Windows:

1. Open a PowerShell and type: `winget install -e --id UB-Mannheim.TesseractOCR` (This tool is provided by Library of University Mannheim: https://ub-mannheim.github.io/Tesseract_Dokumentation/)
2. Download Ghostscript and install from: <https://ghostscript.com/releases/gsdnld.html> (Unfortunately, this needs to be done manually)

Both tools are free and open-source. You can check their requirements on their websites.
